## Control and Status Signals

### Input Signals

#### PSON

Active LOW signal which enables/disables the main output. Pulling this signal LOW will turn-on the main output. Recommended pull-up resistor to 12 VSB is 8.2 k with a 3.0 k pull-down to ground. A 100 pF decoupling capacitor is also recommended.

		MIN	MAX
$V_{IL}$	Input logic level LOW		0.8 V
$V_{IH}$	Input logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		2 mA
$I_{SINK}$	Current that may be sunk by this pin at low state		0.5 mA

#### PSKIL

First break/last mate active LOW signal which enables/disables the main output. This signal will have to be pulled to ground at the system side with a 220 ohm resistor. A 100 pF decoupling capacitor is also recommended.

		MIN	MAX
$V_{IL}$	Input logic level LOW		0.8 V
$V_{IH}$	Input logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		2 mA
$I_{SINK}$	Current that may be sunk by this pin at low state		0.5 mA

#### A0, A1, A2

Addressing pins of the power supply for I<sup>2</sup>C communications. Refer to the addressing tables below.

		MIN	MAX
	Internal pull-ups to 3.3V. It is recommended for the system to have pull-ups and decoupling on the address lines for better noise immunity.	R = 22 k ohm	C = 47 pF
$V_{IL}$	Input logic level LOW		0.8 V
$V_{IH}$	Input logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		4 mA
$I_{SINK}$	Current that may be sunk by this pin	4 mA	

### Output Signals

#### ACOK

Signal used to indicate the presence of AC input to the power supply. A logic level HIGH will indicate that the AC input to the power supply is within the operating range while a logic level LOW will indicate that AC has been lost.

This is an open collector/drain output. This pin is pulled high by a 1.0 k ohm resistor connected to 3.3 V inside the power supply. It is recommended that this pin be connected to a 100 pF decoupling capacitor and pulled down by a 100 k ohm resistor.

		MIN	MAX
$V_{IL}$	Output logic level LOW		0.6 V
$V_{IH}$	Output logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		3.3 mA
$I_{SINK}$	Current that may be sunk by this pin at low state		0.7 mA

## Control and Status Signals

### PWR\_GOOD / PWOK

Signal used to indicate that main output voltage is within regulation range. The PWR\_GOOD signal will be driven HIGH when the output voltage is valid and will be driven LOW when the output falls below the under-voltage threshold.

This signal also gives an advance warning when there is an impending power loss due to loss of AC input or system shutdown request. More details in the Timing Section.

This is an open collector/drain output. This pin is pulled high by a 1.0 k ohm resistor connected to 3.3 V inside the power supply. It is recommended that this pin be connected to a 100 pF decoupling capacitor and pulled down by a 10 k ohm resistor.

		MIN	MAX
$V_{IL}$	Output logic level LOW		0.8 V
$V_{IH}$	Output logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		3.3 mA
$I_{SINK}$	Current that may be sunk by this pin at low state		0.7 mA

### PS\_PRESENT

Signal used to indicate to the system that a power supply is inserted in the power bay. Recommended pull-up resistor to 12 VSB is 8.2 k with a 3.0 k pull-down to ground. A 100 pF decoupling capacitor is also recommended.

### PS\_INTERRUPT

Active low signal used by the power supply to indicate to the system that a change in power supply status has occurred. This event can be triggered by faults such as OVP, OCP, OTP, and fan fault. This signal can be cleared by a CLEAR\_FAULT command. Recommended pull-up resistor to 12 VSB is 8.2 k with a 3.0 k pull-down to ground. A 100 pF decoupling capacitor is also recommended.

		MIN	MAX
$V_{IL}$	Output logic level LOW		0.8 V
$V_{IH}$	Output logic level HIGH	2.0 V	5.0 V
$I_{SOURCE}$	Current that may be sourced by this pin		4 mA
$I_{SINK}$	Current that may be sunk by this pin at low state		4 mA

### BUS Signals

#### ISHARE

Bus signal used by the power supply for active current sharing. All power supplies configured in the system for n+n sharing will refer to this bus voltage in order to load share.

Voltage Range	The range of this signal for active sharing will be up to 8.0 V, which corresponds to the maximum output current.		
		MIN	MAX
$I_{SHARE}$ Voltage	Input logic level LOW	7.75	8.25
	Voltage at 50% load, stand-alone unit	3.85	4.15
	Voltage at 0% load, stand-alone unit	0	0.3
$I_{SOURCE}$	Current that may be sourced by this pin		160 mA

#### SCL, SDA

Clock, data and addressing signals defined as per I<sup>2</sup>C requirements. The maximum system side resistor pull-up and decoupling capacitance

		MIN	MAX
$V_L$	Logic level LOW		0.8 V
$V_H$	Logic level HIGH	2.0 V	5.0 V

**Note:** All signal noise levels are below 400 mVpk-pk from 0 - 100 MHz.
