MA28155

Radiation Hard Programmable Peripheral Interface

Replaces June 1999 version, DS3575-4.0

DS3575-5.0 January 2000

The MA28155 is a general purpose programmable Input/ Output device designed for use with the MAS281 microprocessor. It has 24 I/O pins which may be individually programmed in 2 groups of 12 and used in 3 major modes of operation.

In the first mode (MODE 0), each group of 12 I/O pins may be programmed in sets of 4 to be inputs or outputs. In the second mode (MODE 1), each group may be programmed to have 8 lines of input or output. Of the remaining 4 pins, 3 are used for hand-shaking and interrupt control signals. The third mode of operation (MODE 2) is the bidirectional bus mode, which uses 8 lines for a bidirectional bus and 5 lines, borrowing one from the other group, for hand-shaking.

FEATURES

- Radiation Hard to 1MRad (Si)
- High SEU Immunity, Latch Up Free
- Silicon-on-Sapphire Technology
- 24 Programmable I/O Pins
- All Inputs and Outputs are TTL Compatible
- Direct Bit Set/Reset Capability Easing Control Application Interface
- Replaces Several MSI Packages
- Compatible with MAS281 (Mil-Std-1750A) Microprocessor

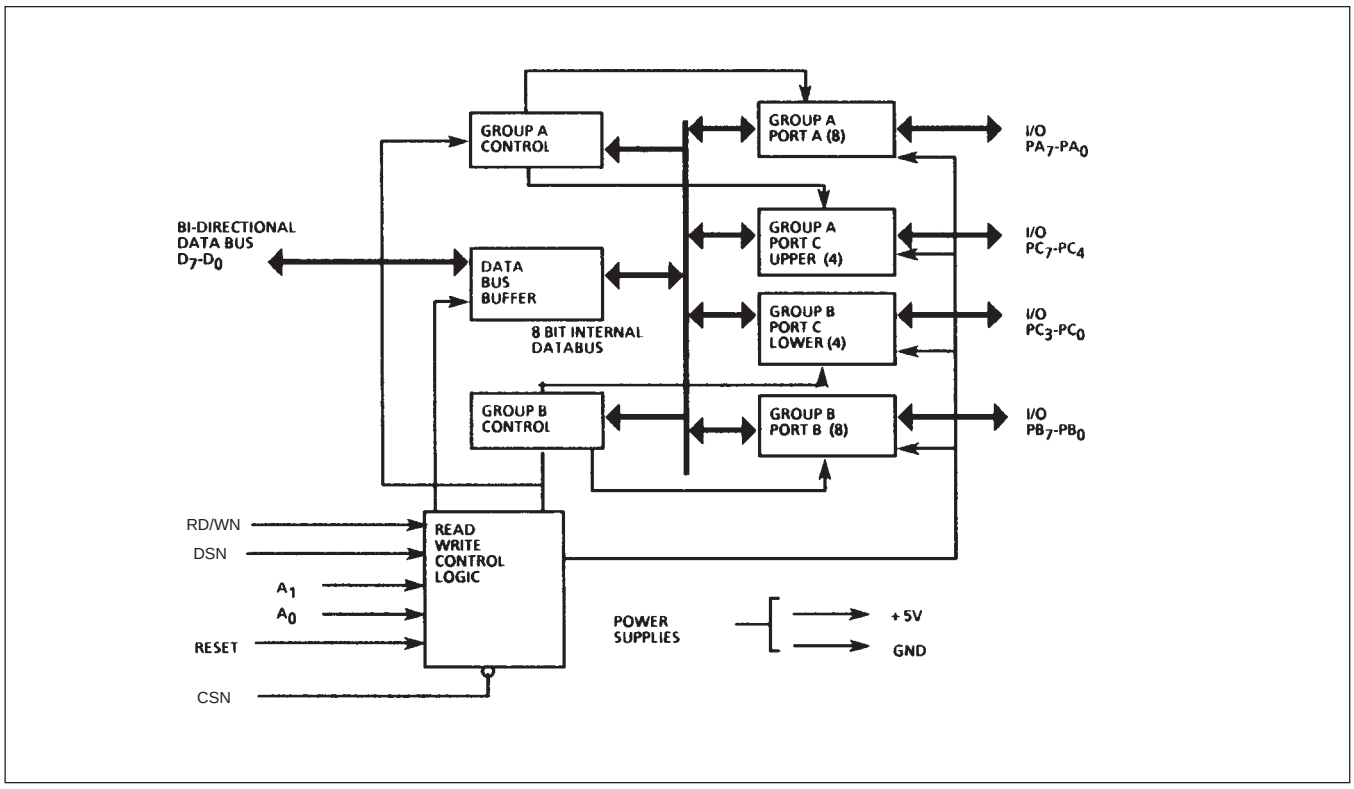

Figure 1: Block Diagram

FUNCTIONAL DESCRIPTION

The MA28155 is a programmable peripheral interface (PPI) device designed for use with MAS281. Its function is that of a general purpose I/O component to interface peripheral equipment to the microcomputer system bus. The functional configuration of the MA28155 is programmed by the system software so that, normally, no external logic is necessary to interface peripheral devices or structures.

Data Bus Buffer

This 3-state, bidirectional, 8-bit buffer is used to interface the MA28155 to the system data bus. Data is transmitted or received by the buffer upon execution of input or output instructions by the CPU. Control words and status information are also transferred through the data bus buffer.

Read/Write and Control Logic

The function of this block is to manage all of the internal and external transfers of both Data and Control Status words. It accepts inputs from the CPU Address and Control busses and in turn, issues commands to both of the Control Groups.

Reset (RESET)

A high on this input clears the control register and all ports (A,B,C) are set to the input mode.

Chip Select (CSN)

A low on this input pin enables the communication between the MA28155 and the CPU.

Read/Write Select (RD/WN)

A high on RD/WN indicates a CPU read from the MA28155 and a low indicates a CPU data or control word write to the MA28155. The RD/WN line is active only when DSN is low.

Data Strobe (DSN)

This input indicates that a data transfer is taking place. During a CPU write operation the MA28155 reads data from the bus on the rising edge of DSN. During a read operation the MA28155 outputs data to the bus while DSN is low. Data is valid on the rising edge of DSN.

Port Select O and Port Select 1 (AO and A1)

These input signals, in conjunction with the DSN and RD/WN inputs, control the selection of one of the three ports of the control word registers. They are normally connected to the least significant bits of the address bus.

Basic Operation

A1	A0	DSN	RD/WN	CSN	READ
0	0	0	1	0	PORT A → DATA BUS
0	1	0	1	0	PORT B → DATA BUS
1	0	0	1	0	PORT C → DATA BUS
					WRITE
0	0	0	0	0	DATA BUS → PORT A
0	1	0	0	0	DATA BUS → PORT B
1	0	0	0	1	DATA BUS → PORT C
1	1	0	0	1	DATA BUS → CONTROL
					DISABLE
x	x	x	x	1	DATA BUS → TRI-STATE
1	1	0	1	0	ILLEGAL CONDITION
x	x	1	x	0	DATA BUS → TRI-STATE

Table 1: Basic Operation

OPERATIONAL DESCRIPTION

Mode Selection

There are three basic modes of operation, which can be selected by the system software:

Mode 0. Basic Input/Output
Mode 1. Strobed Input/Output
Mode 2 Bi-directional Bus

When the reset input goes high all ports will be set to the input mode (i.e. all 24 lines will be in the high impedance state) After the reset is removed the MA28155 can remain in the input mode with no additional initialisation required.

During the execution of the system program any of the other modes may be selected using a single output instruction. This allows a single MA28155 to service a variety of peripheral devices with a single software maintenance routine.

The modes for Port A and Port B can be separately defined, while Port C is divided into two portions as required by the Port A and Port B definitions. All of the output registers, including the status register, will be reset whenever the mode is changed.

Modes may be combined so that their functional definition can be tailored to almost any I/O structure. For instance; Group B can be programmed in Mode 0 whilst Group A could be simultaneously programmed in Mode 1.

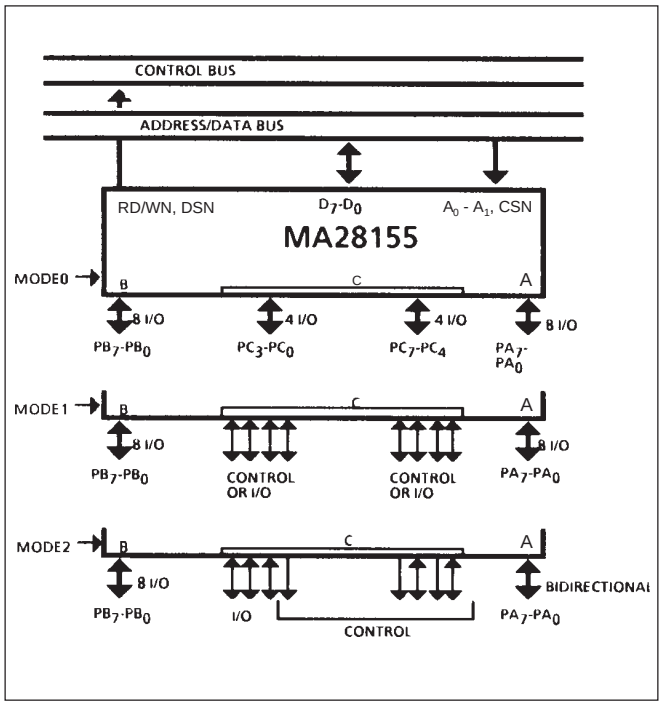

Figure 2: Basic Mode Definitions and Bus Interface

Single Bit Set/Reset Feature

Any of the eight bits of Port C can be Set or Reset using a single output instruction. This feature reduces software requirements in control-based applications.

When Port C is being used as Status/Control for Port A or B, these bits can be set or reset by using the Bit Set/Reset operation just as if they were data output ports.

Interrupt Control Functions

When the MA28155 is programmed to operate in Mode 1 or 2, control signals are provided that can be used as interrupt request inputs to the CPU (figure 4). The interrupt request signals, generated from Port C, can be inhibited or enabled by setting or resetting the associated INTE register bit, using the Bit Set/Reset function of Port C.

This function allows the programmer to disallow or allow a specific I/O device to interrupt the CPU, without affecting any other device in the interrupt structure.

INTE register bit definitions:
(BIT-SET): INTE is SET -Interrupt enable
(BIT-RESET): INTE is RESET -Interrupt disable

Note: All mask register bits are automatically reset during mode selection and device reset.

Mode Definition Format (D_7= 1)

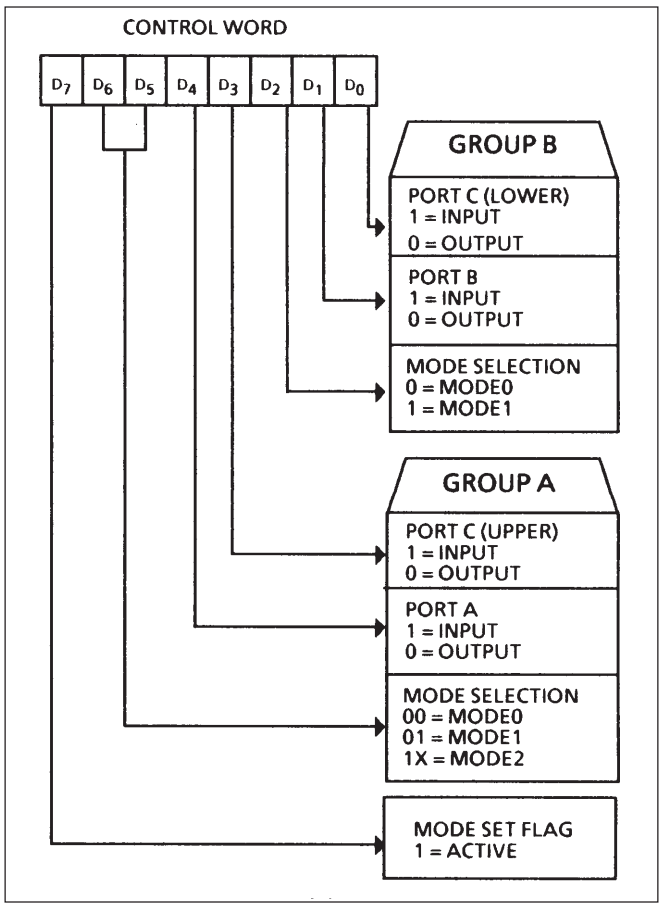

Figure 3: Mode Definition Format (D_7 = 1)

Bit Set/Reset Format (D_7 = 0)

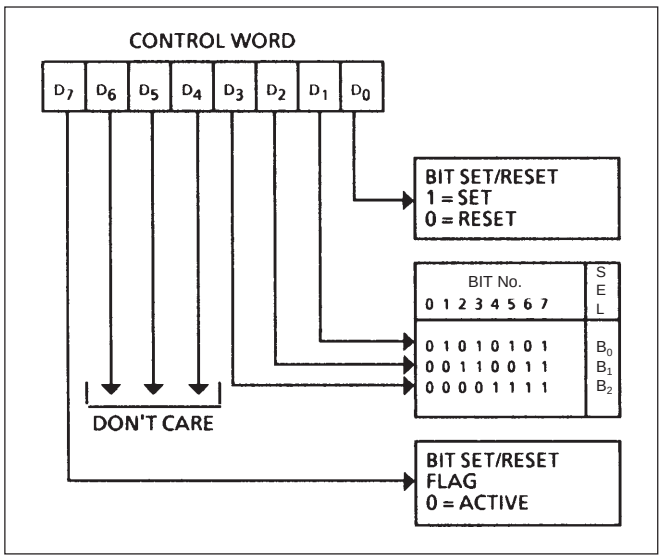

Figure 4: Bit Set/Reset Format (D_7 = 0)

Group A and Group B Controls

The functional configuration of each port is programmed by the system software. In essence, the CPU outputs a control word to the MA28155. The control word contains information such as mode, bit set, bit reset, etc., this initializes the functional configuration of the MA28155.

Each of the Control blocks (Group A and Group B) accept commands from the Read/Write Control Logic, receive control words from the internal data bus and issue the proper commands to its associated ports:

Control Group A - Port A and Port C upper (C7-C4) Control Group B - Port B and Port C lower (C3-C0)

The Control Word Register can only be written into. Therefore reading of the Control Word Register is not allowed .

Ports A, B and C

The MA28155 contains three 8-bit ports (A, B, and C). All can be configured in a wide variety of functional characteristics by the system software but each has its own special features to further enhance the power and flexibility of the MA28155.

Port A.

One 8-bit data output latch/buffer and one 8-bit data input latch.

Port B.

One 8-bit data input/output latch/buffer and one 8-bit input buffer

Port C.

One 8-bit data output latch/buffer and one 8-bit data input buffer (no latch for input) This port can be divided into two 4-bit ports under the mode control. Each 4-bit port contains a 4-bit latch and it can be used for the control signal outputs and status signal inputs in conjunction with ports A and B

OPERATING MODE 0
(Basic Input/Output)

This functional configuration provides simple input and output operation for each of the three ports. No handshaking is required; data is simply written to or read from a specified port.

- Two 8-bit ports and 4-bit ports
- Any port can be input or output
- Outputs are latched
- Inputs are not latched.
- 16 different Input/Output configurations are possible in this Mode.

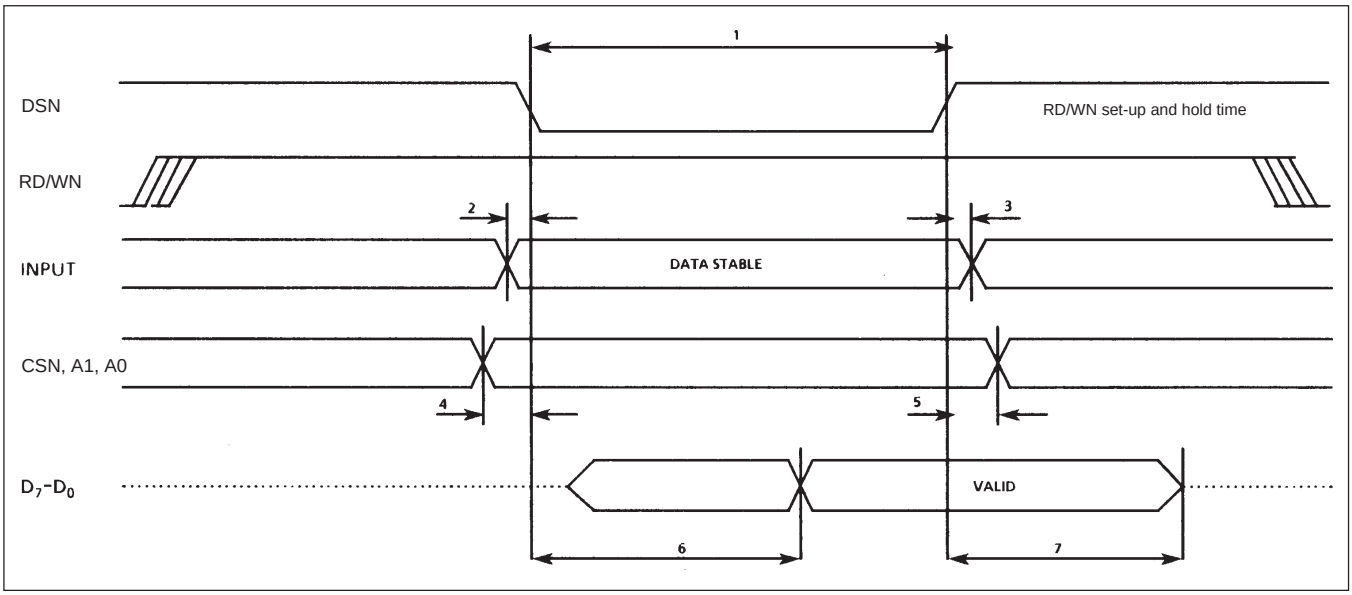

Figure 5: Basic Input (Read) Timing Diagram

1	1	1	1	INPUT	INPUT	INPUT	INPUT

Table 2: Port Definition Mode 0 (See Also Figure 3)

OPERATING MODE 1
(Strobed Input/Output)

This functional configuration provides a means for transferring I/O data to or from a specified port in conjunction with strobes or handshaking signals. In mode 1, port A and port B use the lines on port C to generate or accept these handshaking signals

- Two Groups (Group A and Group B) .
- Each Group contains one 8-bit data port and one 4-bit control/data port,
- The 8-bit data port can be either input or output, Both inputs and outputs are latched,
- The 4-bit port is used for control and status of the 8-bit data port.

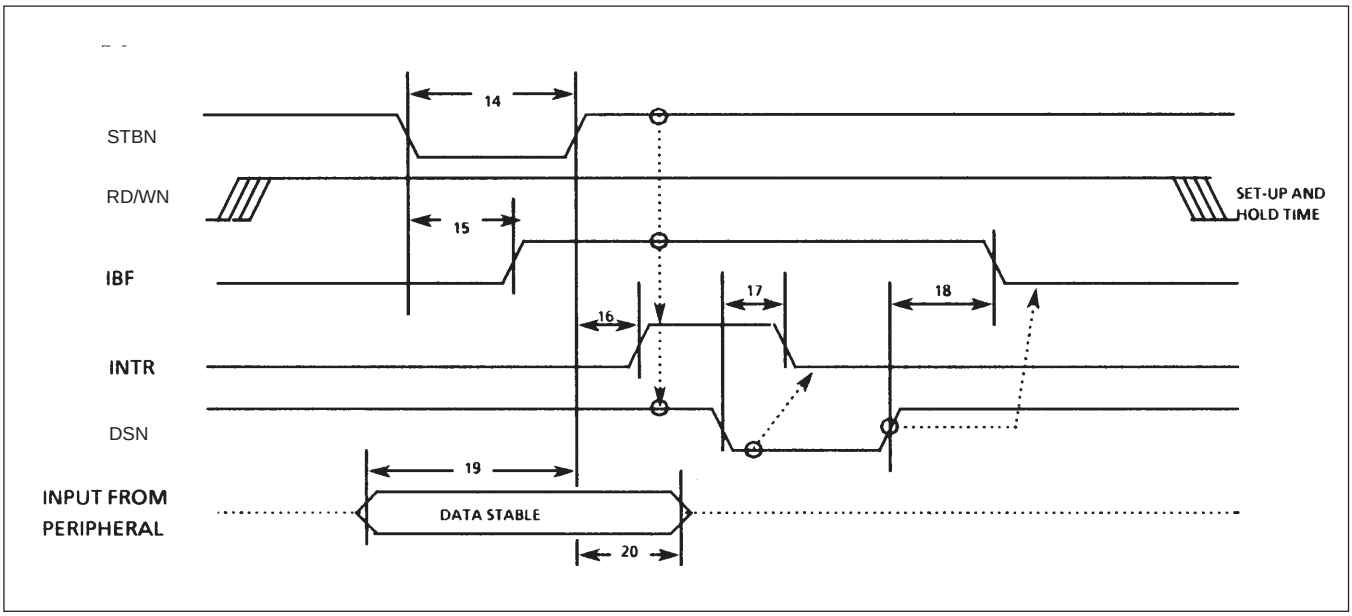

Figure 7: Strobed Input Timing Diagram

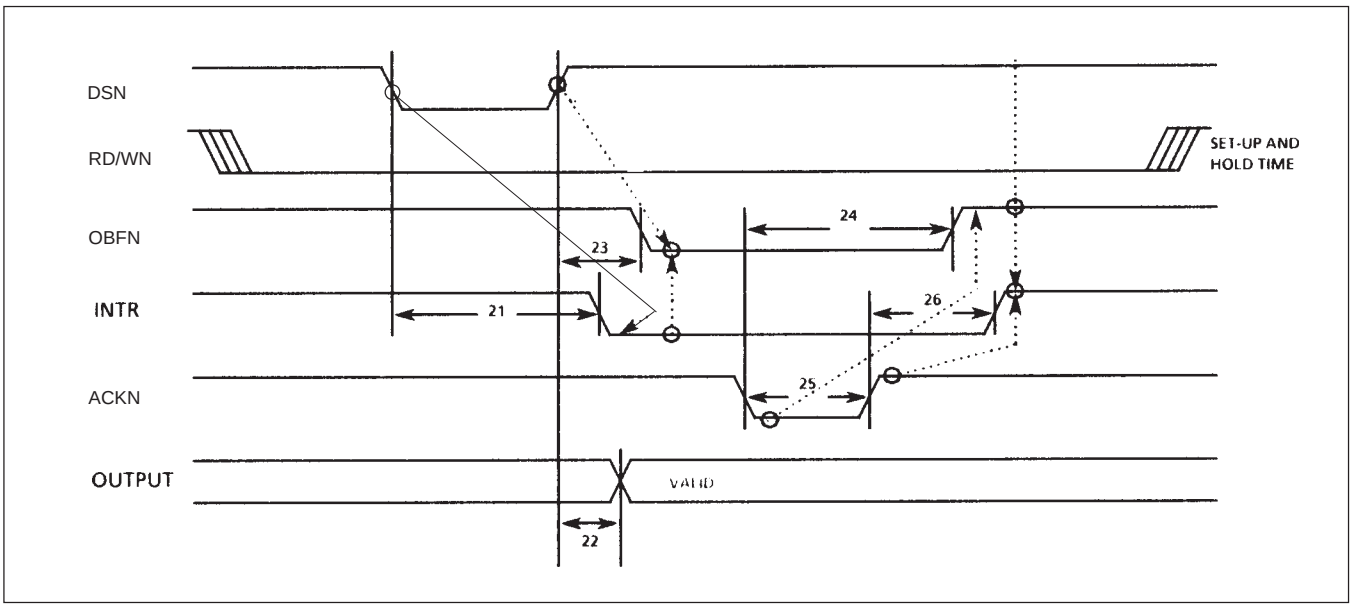

Figure 8: Strobed Output Timing Diagram

Input Control Signal Definition (Mode 1)

STBN (Strobe Input).

A low on this input loads data into the input latch.

IBF (Input Buffer Full Register Bit).

A high on this output indicates that the data has been loaded into the input latch; in essence, an acknowledgement.

IBF is set by a STBN active pulse (which strobes data into the device), and is reset by the rising edge of DSN (which reads the latched data out of the device).

INTR (Interrupt Request).

A high on this output can be used to interrupt the CPU when an input device is requesting service, INTR is set by the STBN being high and IBF being high and INTE being enabled, It is reset by the falling edge of DSN, This procedure allows an input device to request service from the CPU by simply strobing its data into the port,

INTE A: Controlled by bit set/reset of PC_4

INTE B: Controlled by bit set/reset of PC_2

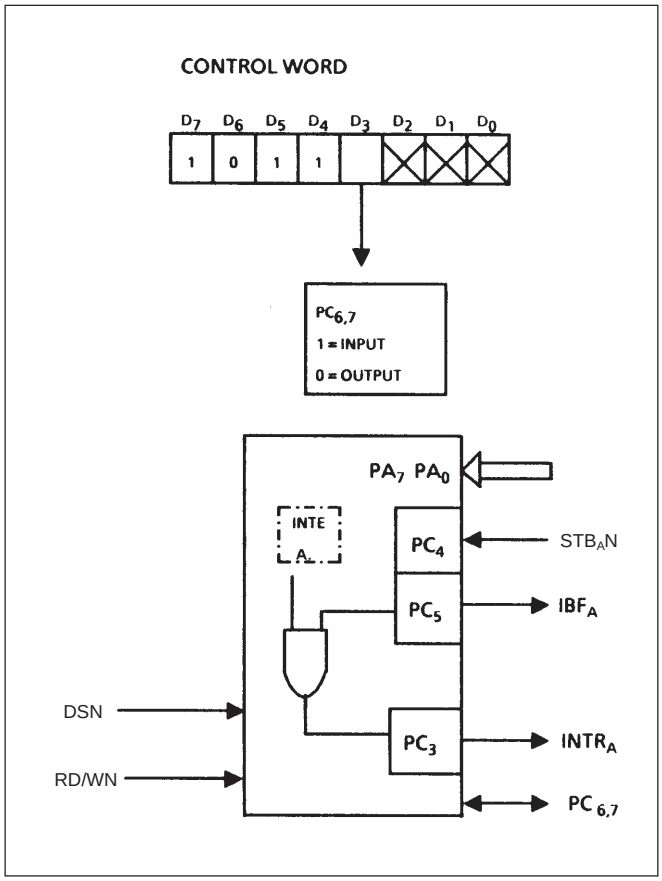

Figure 9: Strobed Input (PORT A)

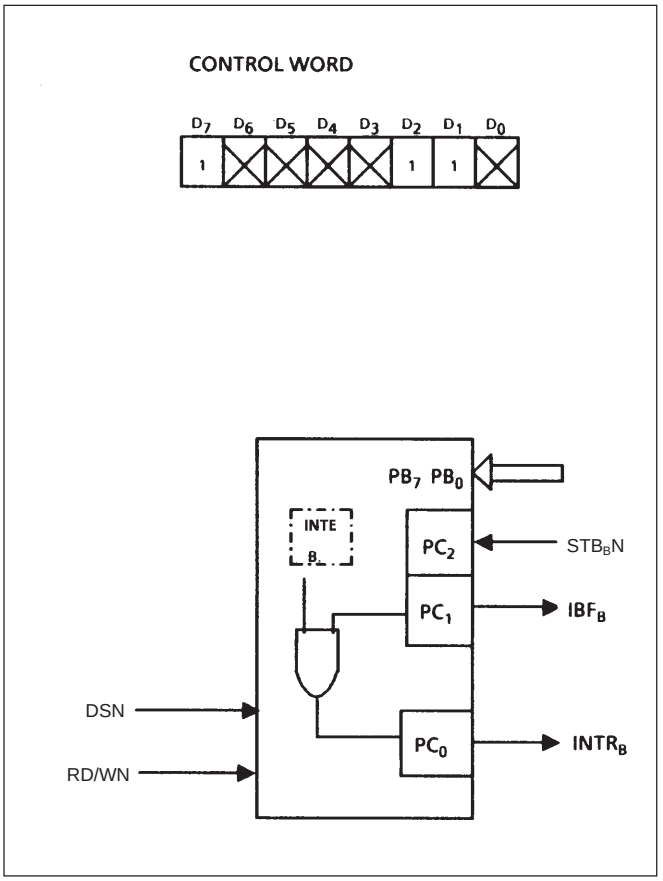

Figure 10: Strobed Input (PORT B)

Output Control Signal Definition (Mode 1)

OBFN (Output Buffer Full Register Bit).

The OBFN output will go low to indicate that the CPU has written data out to the specified port. The OBF register bit will be set by the rising edge of the DSN input and reset by ACKN input being low.

ACKN (Acknowledge Input).

A low on this input informs the 28155 that the data from port A or port B has been accepted; in essence, a response from the peripheral device indicating that it has received the data output by the CPU.

INTR (Interrupt Request).

A high on this output can be used to interrupt the CPU when an output device has accepted data transmitted by the CPU. INTR is set when ACKN is high, OBFN is high and INTE is high. It is reset by the falling edge of DSN.

INTE A: Controlled by bit set/reset of PC_6
INTE B: Controlled by bit set/reset of PC_2

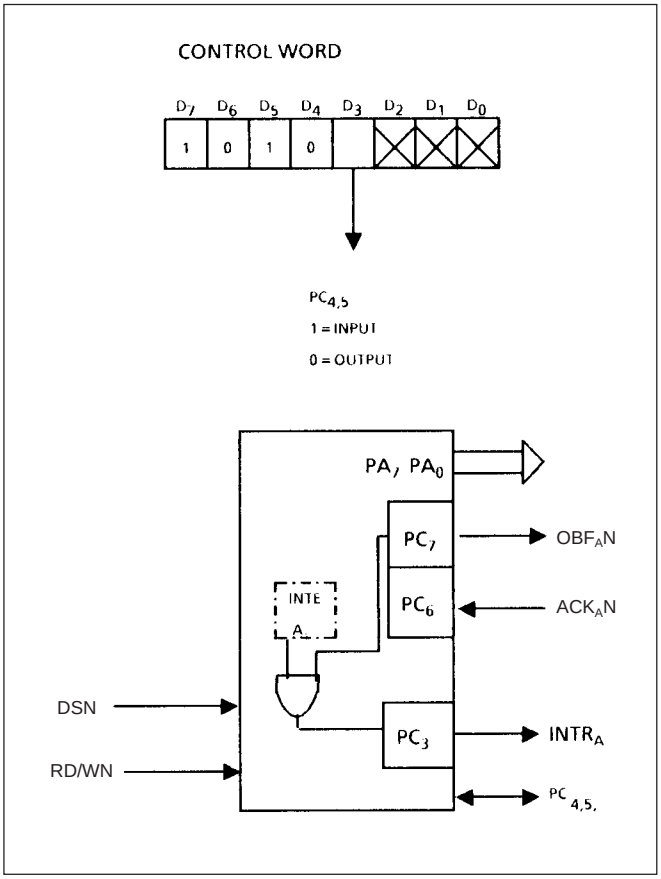

Figure 11: Strobed Output (PORT A)

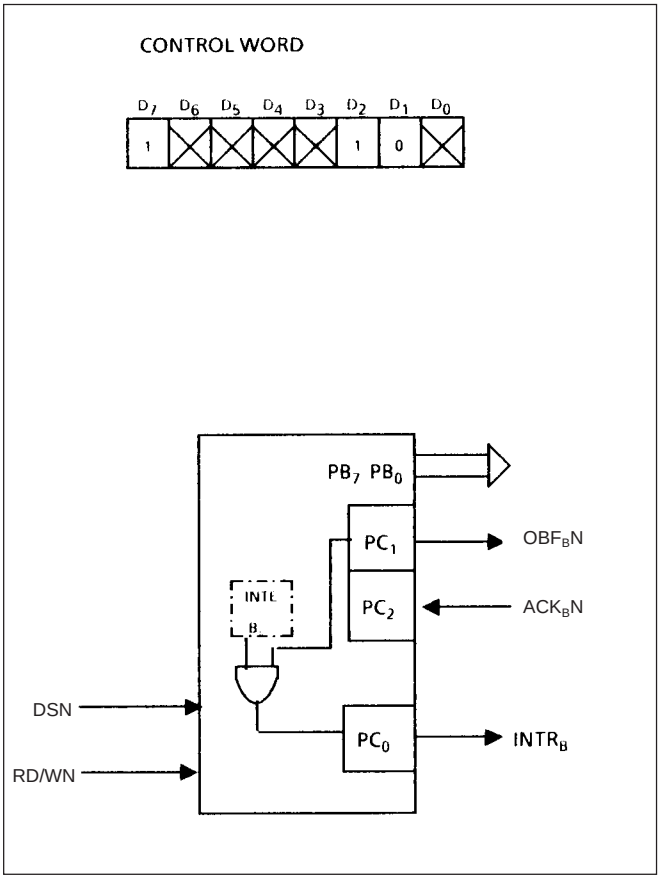

Figure 12: Strobed Output (PORT B)

Combinations of Mode 1

Port A and Port B can be individually defined as input or output in Mode 1 to support a wide variety of strobed I/O applications.

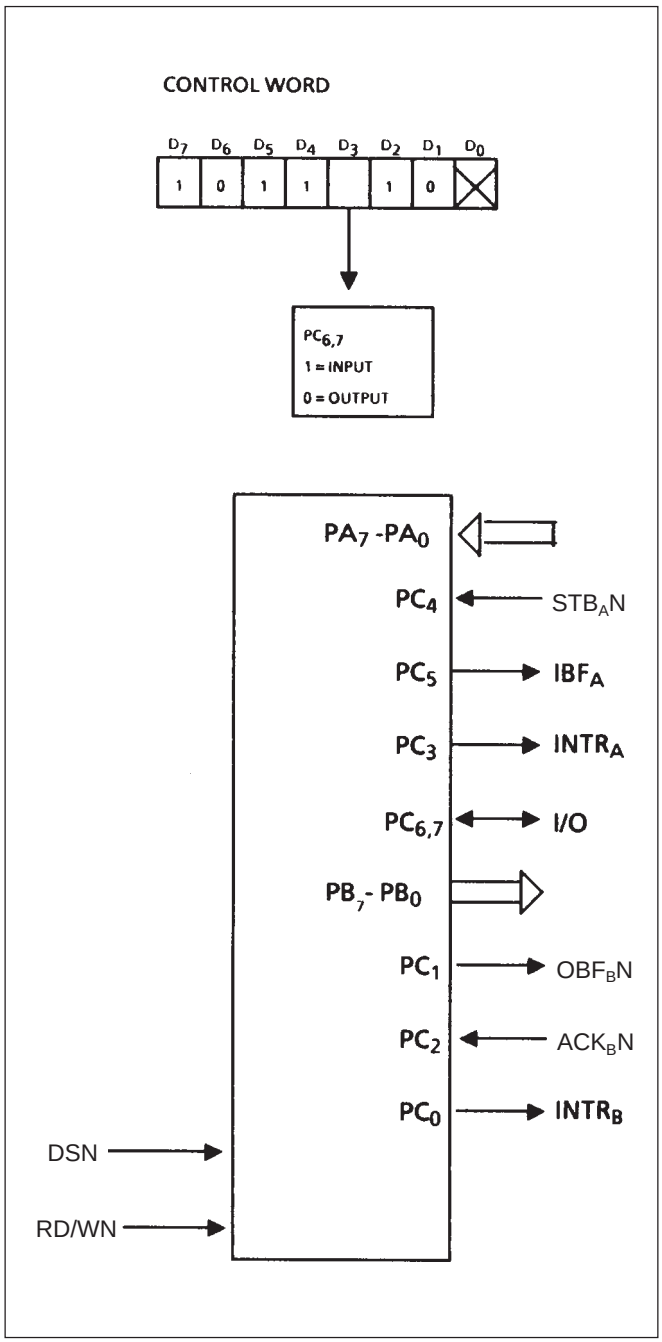

Figure 13: PORT A (STROBED INPUT) PORT B (STROBED OUTPUT)

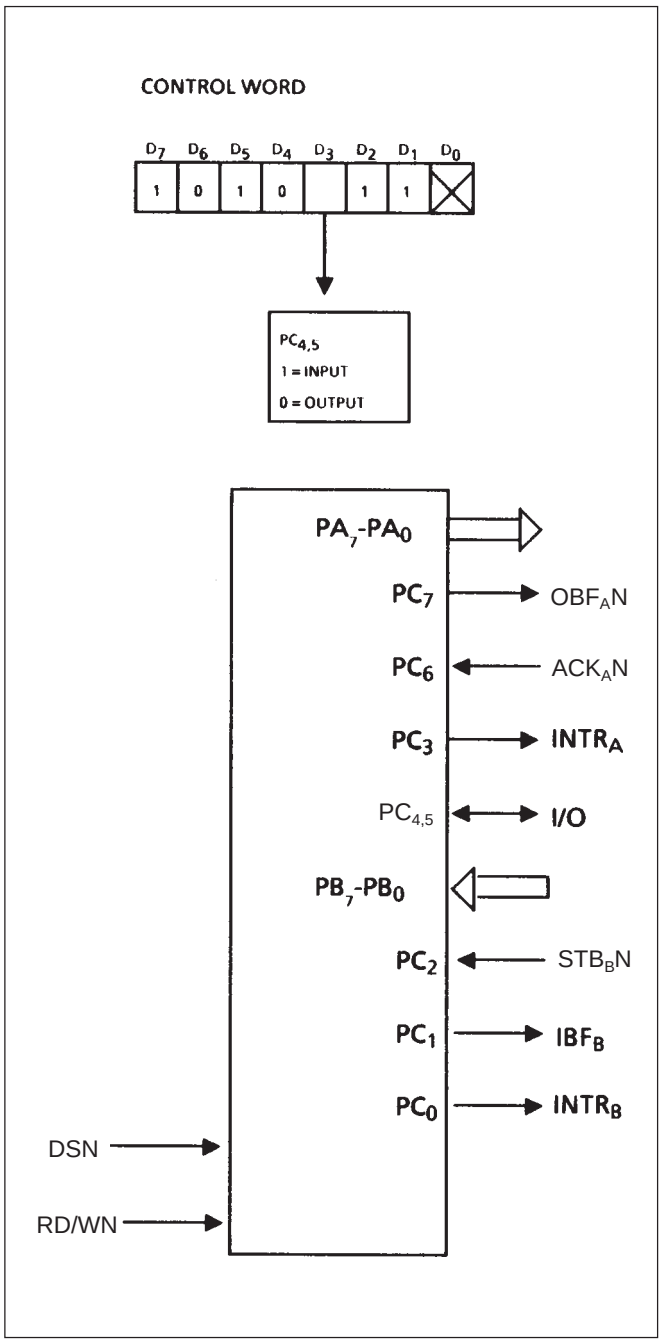

Figure 14: PORT A (STROBED OUTPUT) PORT B (STROBED INPUT)

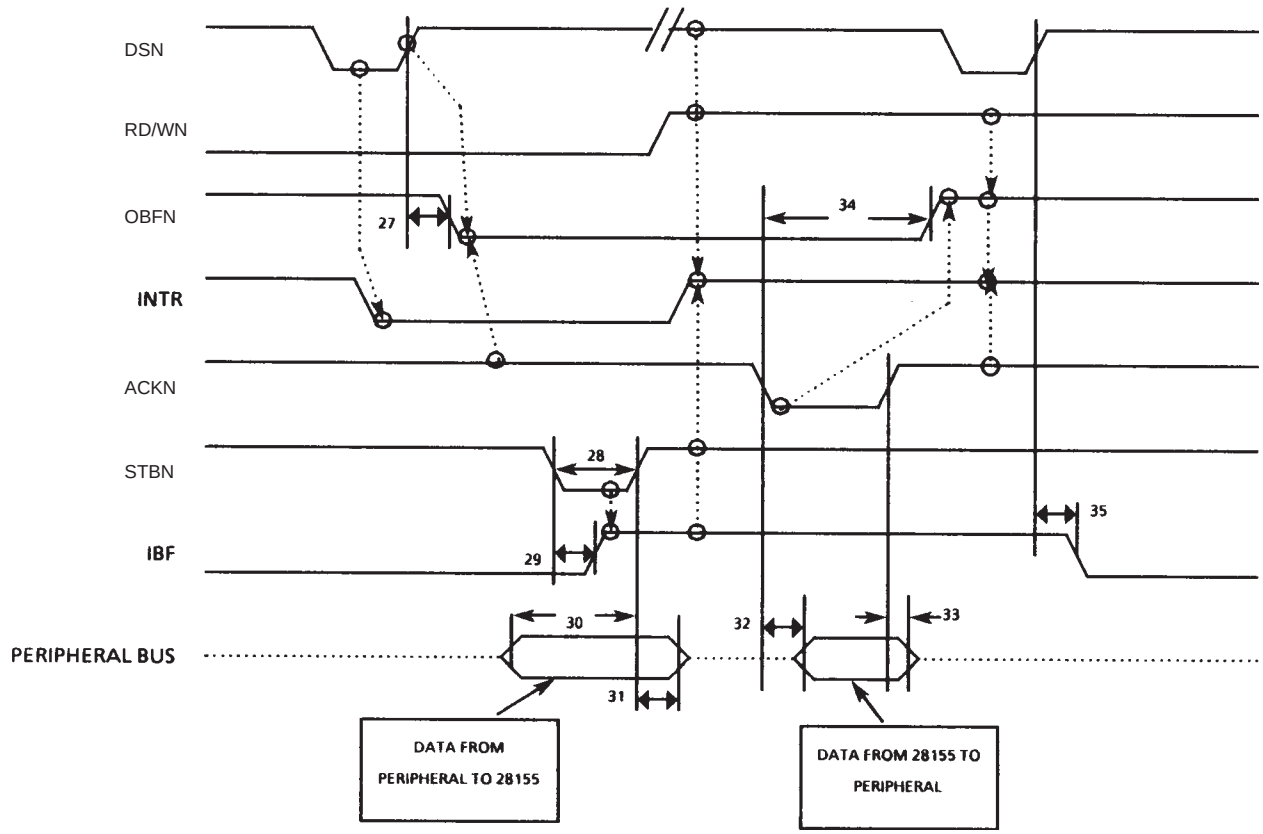
OPERATING MODE 2
(Strobed Bidirectional Bus I/0)

This functional configuration provides a means for communicating with a peripheral device or structure on a single 8-bit bus for both transmitting and receiving data (bidirectional bus I/O) . Handshaking signals are provided to maintain proper bus flow discipline in a similar manner to Mode 1, Interrupt generation and enable/disable functions are also available.

- Used in group A only.
- One 8-bit bidirectional bus port (port A) and 5-bit control port (port C).
- Both inputs and outputs are latched,
- The 5-bit control port (port C) is used for control and status of the 8-bit bidirectional bus port (port A).



NOTE:
Any sequence where RD/WN = 0 coincident with DSN low occurs before ACKN and STBN occurs before RD/WN = 1 coincident with DSN is permissable
(INTR = IBF MASK STBN (RD/WN = 1. DSN = 0) + OBFN MASK ACKN (RD/WN = 0. DSN = 0))

Figure 15: Bidirectional Timing Diagram

BIDIRECTIONAL BUS L/O CONTROL
Signal Definition (Mode 2)

INTR (Interrupt Request):
A high on this output can be used to interrupt the CPU for both input or output operations.

Output Operations

OBFN (Output Buffer Full):
The OBF output will go low to indicate that the CPU has written data out to port A.

ACKN (Acknowledge):
A low on this input enables the tri-state output buffer of port A to send out the data. Otherwise, the output buffer will be in the high impedance state,

INTE 1 (INTE register bit associated with OBFN):
Controlled by Bit Set/Reset of PC_6.

Input Operations

STBN (Strobe input):
A low on this input loads data in to the input latch,

IBF (Input Buffer Full Register Bit):
A high on this output indicates data has been loaded in to the input latch,

INTE 2 (The INTE register bit associated with IBF).
Controlled by Bit Set/Reset of PC_4.

Table 3: Mode Definition Summary

Special Mode Combination Considerations.

There are several combinations of modes when not all of the bits in port C are used for control or status. The remaining bits can be used as follows:

If programmmed as inputs-

All input lines can be accessed during normal port C read.

If programmed as outputs

Bits in C upper (PC7-PC4) must be individually accessed using a bit set/reset function.

Bits in C lower (PC3-PC0) can be accessed using the bit set/reset function or bits PC2-PC0 may also be accessed as a trio by writing into port C.

Reading Port C Status.

In Mode 0 Port C transfers data from or to the peripheral device, When the MA28155 is programmed to function in Modes 1 or 2 Port C generates or accepts handshaking signals with the peripheral device, Reading the contents of Port C allows the programmer to test or verify the status of each peripheral device and change the program flow accordingly.

There is no special instruction to read the Status Information from Port C. A normal read operation of Port C is executed to perform this function.

RADIATION TOLERANCE

Total Dose Radiation Testing

For product procured to guaranteed total dose radiation levels, each wafer lot will be approved when all sample devices from each lot pass the total dose radiation test.

The sample devices will be subjected to the total dose radiation level (Cobalt-60 Source), defined by the ordering code, and must continue to meet the electrical parameters specified in the data sheet. Electrical tests, pre and post irradiation, will be read and recorded.

Dynex Semiconductor can provide radiation testing compliant with Mil-Std-883 test method 1019, Ionizing Radiation (Total Dose).

Total Dose (Function to specification)*	$3x10^5$ Rad(Si)
Transient Upset (Stored data loss)	$5x10^{10}$ Rad(Si)/sec
Transient Upset (Survivability)	$>1x10^{12}$ Rad(Si)/sec
Neutron Hardness (Function to specification)	$>1x10^{15}$ n/cm^2
Single Event Upset**	$<1x10^{-10}$ Errors/bit day
Latch Up	Not possible

* Other total dose radiation levels available on request

** Worst case galactic cosmic ray upset - interplanetary/high altitude orbit

Datasheet Annotations:

Dynex Semiconductor annotate datasheets in the top right hard corner of the front page, to indicate product status. The annotations are as follows:-

Target Information: This is the most tentative form of information and represents a very preliminary specification. No actual design work on the product has been started.

Preliminary Information: The product is in design and development. The datasheet represents the product as it is understood but details may change.

Advance Information: The product design is complete and final characterisation for volume production is well in hand.

No Annotation: The product parameters are fixed and the product is available to datasheet specification.

ООО «НИОКРсистемс» - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование
- Работаем по 275 ФЗ
