

TELEPHONE SPEECH NETWORK WITH DIALER INTERFACE

DESCRIPTION

The ILA1062 and ILA1062A are integrated circuits that perform all speech and line interface functions required in fully electronic telephone sets. They perform electronic switching between dialing and speech. The ICs operate at line voltage down to 1.6 V DC (with reduced performance) to facilitate the use of more telephone sets connected in parallel.

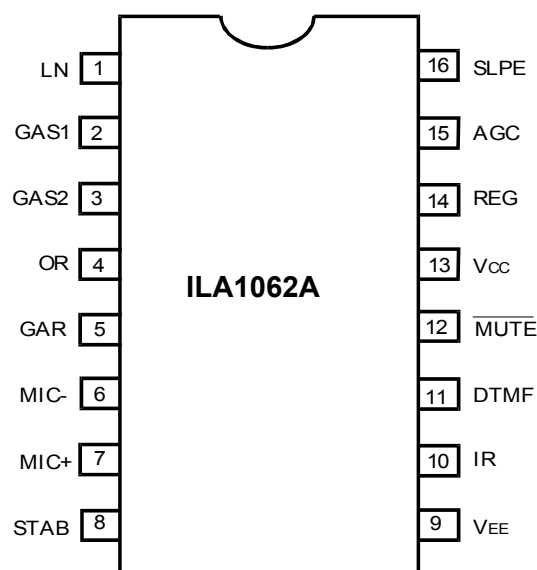

All statements and values refer to all versions unless otherwise specified. The ILA1062(ILA1062A) is packaged in a standard

16-pin plastic DIP and special plastic DIP with internal heatsink is also available.

FEATURES

- Low DC line voltage; operates down to 1.6V (excluding polarity guard)
- Voltage regulator with adjustable static resistance
- Provides a supply for external circuits
- Symmetrical high-impedance inputs (64 k Ω) for dynamic, magnetic or piezo-electric microphones
- Asymmetrical high-impedance input (32 k Ω) for electret microphones
- DTMF signal input with confidence tone
- Mute input for pulse or DTMF dialing
 - ILA1062: active HIGH (MUTE)
 - ILA1062A: active LOW (MUTE)
- Receiving amplifier for dynamic, magnetic or piezo-electric earpieces
- Large gain setting range on microphone and earpiece amplifiers
- Line loss compensation (line current dependent) for microphone and earpiece amplifiers
- Gain control curve adaptable to exchange supply
- DC line voltage adjustment facility

FUNCTIONAL DESCRIPTION

Supplies V_{CC} , LN, SLPE, REG and STAB

Power for the IC and its peripheral circuits is usually obtained from the telephone line. The supply voltage is delivered from the line via a dropping resistor and regulated by the IC. The supply voltage V_{CC} may also be used to supply external circuits e.g. dialing and control circuits.

Decoupling of the supply voltage is performed by a capacitor between V_{CC} and V_{EE} . The internal voltage regulator is decoupled by a capacitor between REG and V_{EE} .

The DC current flowing into the set is determined by the exchange supply voltage V_{exch} , the feeding bridge resistance R_{exch} and the DC resistance of the telephone line R_{line} .

The circuit has internal current stabilizer operating at a level determined by a 3.6 k Ω resistor connected between STAB and V_{EE} (see Fig.6). When the line current (I_{line}) is more than 0.5mA greater than the sum of the IC supply current (I_{CC}) and the current drawn by the peripheral circuitry connected to V_{CC} (I_p) the excess current is shunted to V_{EE} via LN.

The regulated voltage on the line terminal (V_{LN}) can be calculated as:

$$V_{LN} = V_{ref} + I_{SLPE} \times R_9$$

$$V_{LN} = V_{ref} + \{(I_{line} - I_{CC} - 0.5 \times 10^{-3}A) - I_p\} \times R_9$$

V_{ref} is an internally generated temperature compensated reference voltage of 3.7V and R_9 is an external resistor connected between SLPE and V_{EE} .

In normal use the value of R_9 would be 20 Ω .

Changing the value of R_9 will also affect microphone gain, DTMF gain, gain control characteristics, sidetone level, maximum output swing on LN and the DC characteristics (especially at the lower voltages).

Fig.2 Equivalent impedance circuit

Under normal conditions, when $I_{SLPE} \gg I_{CC} + 0.5mA + I_p$, the static behaviour of the circuit is that of a 3.7V regulator diode with an internal resistance equal to that of R_9 . In the audio frequency range the dynamic impedance is largely determined by R_1 . Fig.2 show the equivalent impedance of the circuit.

At line currents below 9mA the internal reference voltage is automatically adjusted to a lower value (typically 1.6V at 1mA). This means that more sets can be operated in parallel with DC line voltage (excluding the polarity guard) down to an absolute minimum voltage of 1.6V. At line currents below 9mA the circuit has limited sending and receiving levels. The internal reference voltage can be adjusted by means of an external resistor (R_{VA}). This resistor when connected between LN and REG will decrease the internal reference voltage and when connected between REG

and SLPE will increase the internal reference voltage.

Microphone inputs MIC+ and MIC- and gain pins GAS1 and GAS2

The circuit has symmetrical microphone inputs. Its input impedance is 64 k Ω ($2 \times 32k\Omega$) and its voltage gain is typically 52 dB (when $R_7 = 68k\Omega$; see Fig.6).

Dynamic, magnetic, piezo-electric or electret (with built-in FET source followers) can be used.

The gain of the microphone amplifier can be adjusted between 44 dB and 52 dB to suit the sensitivity of the transducer in use. The gain is proportional to the value of R_7 which is connected between GAS1 and GAS2.

Stability is ensured by two external capacitors, C_6 connected between GAS1 and SLPE and C_8 connected between GAS1 and V_{EE} . The value of C_6 is 100pF but this may be increased to obtain a first-order low-pass

filter. The value of C8 is 10 times the value of C6. The cut-off frequency corresponds to the time constant $R7 \times C6$.

Input MUTE (ILA1062)

When MUTE is LOW or open-circuit, the DTMF input is enable and the microphone and receiving amplifier inputs are inhibited. The reverse is true when MUTE is HIGH.

MUTE switching causes only negligible clicking on the line and earpiece output. If the number of parallel sets in use causes a drop in line current to below 6 mA the DTMF amplifier becomes active independent to the DC level applied to the MUTE input.

Dual-tone multi-frequency input DTMF

When the DTMF input is enable dialing tones may be sent on to the line. The voltage gain from DTMF to LN is typically 25.5 dB (when $R7=68k\Omega$) and varies with $R7$ in the same way as the microphone gain. The signalling tones can be heard in the earpiece at a low level (confidence tone).

Receiving amplifier IR, QR and GAR

The receiving amplifier has one input (IR) and a non-inverting output (QR). The IR to QR gain is typically 31dB (when $R4 = 100k\Omega$). It can be adjusted between 20 and 31dB to match the sensitivity of the transducer in use. The gain is set with the value of $R4$ which is connected between GAR and QR. The overall receive gain, between LN and QR, is calculated by subtracting the anti-sidetone network attenuation (32dB) from the amplifier gain. Two external capacitors, C4 and C7, ensure stability. C4 is normally 100pF and C7 is 10 times the value of C4. The value of C4 may be increased to obtain a first-order low-pass filter. The cut-off frequency will depend on the time constant $R4 \times C4$.

The output voltage of the receiving amplifier is specified for continuous-wave drive. The maximum output voltage will be higher under speech conditions where the peak to RMS ratio is higher.

Automatic gain control input AGC

Automatic line loss compensation is achieved by connecting a resistor ($R6$) between AGC and V_{EE} .

The automatic gain control varies the gain of the microphone amplifier and the receiving amplifier in accordance with the DC line current. The control range is 5.8 dB which corresponds to a line length of 5 km for a

0.5mm diameter twisted-pair copper cable with a DC resistance of 176 Ω /km and average attenuation of 1.2dB/km. Resistor $R6$ should be chosen in accordance with the exchange supply voltage and its feeding bridge resistance. The ratio of start and stop currents of the AGC curve is independent of the value of $R6$. If no automatic

line-loss compensation is required the AGC pin may be left open-circuit. The amplifiers, in this condition, will give their maximum specified gain.

Sidetone suppression

The anti-sidetone network, $R1/Z_{line}$, $R2$, $R3$, $R8$, $R9$ and Z_{bal} suppresses the transmitted signal in the earpiece. Maximum compensation is obtained when the following conditions are fulfilled:

$$R9 \times R2 = R1 \times R3 + \left(\frac{R8 \times Z_{bal}}{R8 + Z_{bal}} \right) \quad (1)$$

$$\frac{Z_{bal}}{Z_{bal} + R8} = \frac{Z_{line}}{Z_{line} + R1} \quad (2)$$

If fixed values are chosen for $R1$, $R2$, $R3$ and $R9$, then condition (1) will always be fulfilled when

To obtain optimum sidetone suppression, condition (2) has to be fulfilled which results in:

$$Z_{bal} = \frac{R_8}{R_1} \times Z_{line} = k \times Z_{line}$$

Where k is scale factor; $k = \frac{R_8}{R_1}$

The scale factor k, dependent on the value of R8, is chosen to meet the following criteria:

- compatibility with a standard capacitor from the E6 or E12 range for Z_{bal}
- $|Z_{bal}/R_8| \ll R_8$ fulfilling condition (a) and thus ensuring correct anti-sidetone bridge operation
- $|Z_{bal} + R_8| \gg R_9$ to avoid influencing the transmit gain.

In practise Z_{line} varies considerably with the line type and length. The value chosen for Z_{bal} should therefore be for an average line thus giving optimum setting for short or long lines.

ABSOLUTE MAXIMUM RATING

Characteristic		Symbol	Test Condition	Min	Typ	Max	Unit
Positive Continuous Line Voltage		V_{LN}				12	V
Repetitive Line Voltage During Switch-on or Line Interruption		$V_{LN(R)}$				13.2	V
Repetitive Peak Line Voltage for a 1ms Pulse per 5s		$V_{LN(RM)}$	R9 = 20W; R10 = 13W; see Fig.6			28	V
Line Current		I_{line}	R9 = 20W; note 1			140	mA
Input Voltage on all other Pins		V_I		-0.7		$V_{CC}+0.7$	V
Total Power Dissipation	Standard DIP	P_{tot}	R9 = 20W; note 2			0.58	W
	DIP with heatsink					0.67	
Operating Ambient Temperature		T_A		-25		+75	°C
Storage Temperature		T_{stg}		-40		+125	°C
Junction Temperature		T_j				+125	°C

Notes

1. Mostly dependent on the maximum required T_A and on the voltage between LN and SLPE.
2. Calculated for the maximum ambient temperature specified and a maximum junction temperature of 125°C.

(Thermal Resistance $R_{JA} = 85^\circ\text{C/W}$ for standard DIP and $R_{JA} = 75^\circ\text{C/W}$ for special DIP with heatsink).

Note 1. Pin 12 is active HIGH (MUTE) for ILA1062

APPLICATION INFORMATION

The diode bridge, the Zener and R10 limit the current into, and the voltage across, the circuit during line transients. A different protection arrangement is required for pulse dialling or register recall. The DC line voltage can be set to a higher value by the resistor R_{W} (REG to SLPE). (1) Pin 12 is active HIGH (MUTE) for BT1062.

Fig. 6 Typical application of ILA1062A, with piezo-electric earpiece and DTMF dialling

ООО «НИОКРсистемс» - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование
- Работаем по 275 ФЗ
