

AMMC-6440

37 - 42 GHz Power Amplifier

Data Sheet

Chip Size: 2500 x 1750 μm (100 x 69 mils)
Chip Size Tolerance: $\pm 10 \mu\text{m}$ (± 0.4 mils)
Chip Thickness: $100 \pm 10 \mu\text{m}$ (4 ± 0.4 mils)
Pad Dimensions: $100 \times 100 \mu\text{m}$ (4 ± 0.4 mils)

Description

The AMMC-6440 MMIC is a broadband 1W power amplifier designed for use in transmitters that operate in various frequency bands between 37GHz and 42GHz. This MMIC optimized for linear operation with an output third order intercept point (OIP3) of 38dBm. At 42GHz it provides 28dBm of output power (P-1dB) and 14dB of gain. The device has input and output matching circuitry for use in 50Ω environments. The AMMC-6440 also integrates a temperature compensated RF power detection circuit that enables power detection of 0.25V/W. DC bias is simple and the device operates on widely available 5.5V for current supply (negative voltage only needed for Vg). It is fabricated in a PHEMT process for exceptional power and gain performance. For improved reliability and moisture protection, the die is passivated at the active areas.

Features

- Wide frequency range: 37 - 42 GHz
- High gain: 14 dB
- Power: @42 GHz, P-1 dB=28 dBm
- Highly linear: OIP3=39dBm
- Integrated RF power detector
- 5.5 Volt, -0.7 Volt, 950mA operation

Applications

- Microwave Radio systems
- LMDS & Pt-Pt mmW Long Haul
- 802.16 & 802.20 WiMax BWA
- WLL and MMDS loops
- Can be driven by AMMC-6345, increasing overall gain

Note: These devices are ESD sensitive. The following precautions are strongly recommended. Ensure that an ESD approved carrier is used when dice are transported from one destination to another. Personal grounding is to be worn at all times when handling these devices

Absolute Maximum Ratings [AMMC-6440]

Symbols	Parameters	Units	Min.	Max.	Notes
Vd-Vg	Drain to Gate Voltage	V		8	
Vd	Positive Supply Voltage	V		5.5	
Vg	Gate Supply Voltage	V	-2.5	0.5	
Id	Drain Current	mA		TBD	2
PD	Power Dissipation	W		5.5	2, 3
Pin	CW Input Power	dBm		20	2
Tch	Operating Channel Temp	°C		+150	4
Tstg	Storage Case Temp.	°C		-65 to +155	
Tmax	Maximum Assembly Temp (30 sec max)	°C		+320	

Notes:

1. Operation in excess of any one of these conditions may result in permanent damage to this device. Functional operation at or near these limitations will significantly reduce the lifetime of the device.
2. Dissipated power PD is in any combination of DC voltage, Drain Current, input power and power delivered to the load.
3. When operated at maximum PD with a base plate temperature of 85 °C, the median time to failure (MTTF) is significantly reduced.
4. These ratings apply to each individual FET. The operating channel temperature will directly affect the device MTTF.
For maximum life, it is recommended that junction temperatures (Tj) be maintained at the lowest possible levels. See MTTF vs. Channel temperature Table

AMMC-6440 DC Specifications/Physical Properties [1]

Symbol	Parameters and Test Conditions	Units	Min.	Typ.	Max.
Id	Drain Supply Current (under any RF power drive and temperature) (Vd=5.5 V, Vg set for Id Typical)	mA		950	1050
Vg	Gate Supply Operating Voltage (Id(Q) = 950 (mA))	V	-0.85	-0.7	-0.65
qch-b	Thermal Resistance [2] (Backside temperature, Tb = 25°C)	°C/W		6.4	

Notes:

1. Ambient operational temperature TA=25°C unless otherwise noted.
2. Channel-to-backside Thermal Resistance (θ_{ch-b}) = 9.0°C/W at Tchannel (Tc) = 70°C as measured using infrared microscopy. Thermal Resistance at backside temperature (Tb) = 25°C calculated from measured data.

Thermal Properties

Parameter	Test Conditions	Value
Maximum Power Dissipation	Tbaseplate = 85°C	PD = 5.5W Tchannel = 150°C
Thermal Resistance (θ_{jc})	Vd = 5.5V Id = 950mA PD = 5.23W Tbaseplate = 85°C	θ_{jc} = 6.4°C/W Tchannel = 118°C
Thermal Resistance (θ_{jc}) Under RF Drive	Vd = 5.5V Id = 1095mA Pout = 28dBm Pd = 5.43W Tbaseplate = 85°C	θ_{jc} = 6.4°C/W Tchannel = 120°C

RLout	Output Return Loss ^[2]	dB		-18		0.71
Isolation	Min. Reverse Isolation	dB		-47		3.00

Notes:

- Small/Large -signal data measured in wafer form $T_A = 25^\circ\text{C}$.
- 100% on-wafer RF test is done at frequency = 38, 40, and 42 GHz. Statistics based on 1500 part sample
- Specifications are derived from measurements in a 50 Ω test environment. Aspects of the amplifier performance may be improved over a more narrow bandwidth by application of additional conjugate, linearity, or power matching.

Note:

Data obtained from on-wafer measurements.

Biasing and Operation

The recommended quiescent DC bias condition for optimum efficiency, performance, and reliability is $V_d=5.5$ volts with V_g set for $I_d=950$ mA. Minor improvements in performance are possible depending on the application. The drain bias voltage range is 3 to 5.5V. A single DC gate supply connected to V_g will bias all gain stages. Muting can be accomplished by setting V_g and /or V_g to the pinch-off voltage V_p .

An optional output power detector network is also provided. The differential voltage between the Det-Ref and Det-Out pads can be correlated with the RF power emerging from the RF output port. The detected voltage is given by :

$$V = (V_{ref} - V_{det}) - V_{ofs}$$

where V_{ref} is the voltage at the DET_R port, V_{det} is a voltage at the DET_O port, and V_{ofs} is the zero-input-power offset voltage. There are three methods to calculate :

1. V_{ofs} can be measured before each detector measurement (by removing or switching off the power source and measuring). This method gives an error due to temperature drift of less than 0.01dB/50°C.
2. V_{ofs} can be measured at a single reference temperature. The drift error will be less than 0.25dB.
3. V_{ofs} can either be characterized over temperature and stored in a lookup table, or it can be measured at two temperatures and a linear fit used to calculate at any temperature. This method gives an error close to the method #1.

The RF ports are AC coupled at the RF input to the first stage and the RF output of the final stage. No ground wires are needed since ground connections are made with plated through-holes to the backside of the device.

Assembly Techniques

The backside of the MMIC chip is RF ground. For microstrip applications the chip should be attached directly to the ground plane (e.g. circuit carrier or heatsink) using electrically conductive epoxy [1,2].

For best performance, the topside of the MMIC should be brought up to the same height as the circuit surrounding it. This can be accomplished by mounting a gold plate metal shim (same length and width as the MMIC) under the chip which is of correct thickness to make the chip and adjacent circuit the same height. The amount of epoxy used for the chip and/or shim attachment should be just enough to provide a thin fillet around the bottom perimeter of the chip or shim. The ground plain should be free of any residue that may jeopardize electrical or mechanical attachment.

The location of the RF bond pads is shown in Figure 12. Note that all the RF input and output ports are in a Ground-Signal configuration.

RF connections should be kept as short as reasonable to minimize performance degradation due to undesirable series inductance. A single bond wire is normally sufficient for signal connections, however double bonding with 0.7 mil gold wire or use of gold mesh is recommended for best performance, especially near the high end of the frequency band.

Thermosonic wedge bonding is preferred method for wire attachment to the bond pads. Gold mesh can be attached using a 2 mil round tracking tool and a tool force of approximately 22 grams and a ultrasonic power of roughly 55 dB for a duration of 76 +/- 8 mS. The guided wedge at an ultrasonic power level of 64 dB can be used for 0.7 mil wire. The recommended wire bond stage temperature is 150 +/- 2°C.

Caution should be taken to not exceed the Absolute Maximum Rating for assembly temperature and time.

The chip is 100um thick and should be handled with care. This MMIC has exposed air bridges on the top surface and should be handled by the edges or with a custom collet (do not pick up the die with a vacuum on die center).

This MMIC is also static sensitive and ESD precautions should be taken.

Notes:

1. Ablebond 84-1 LM1 silver epoxy is recommended.
2. Eutectic attach is not recommended and may jeopardize reliability of the device.

ООО «НИОКРсистемс» - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование
- Работаем по 275 ФЗ
